In Visual Studio:

The time it took to read and write line-by-line was faster than the time it took for character-by-character to be read and written.

In VMWare:

The time it took to read and write line-by-line was faster than the time it took for character-by-character to be read and written.

Comparing both operating systems, it was clear that Linux is much faster than running the program on Windows. They both had the same result for line-by-line vs. character-by-character. For both operating systems line-by-line was much faster than character-by-character.
